

# Multimedia Presentation

This presentation shows how to hyperlink to a video clip, using the system video player. The video clip is in a directory on my computer, so you will not be able to access it.

The hyperlink will be on the next slide.

/home/rory/Desktop/Buffalo/Presentations/Elizabethan Life/Ovation.avi

Ovation from Shakespeare in Love

The Sun Shines Bright

One should click the hyperlink in the previous slide to play the video.

On the previous slide I have also entered the same hyperlink, concealing it behind a descriptive title – that also will work.

The third link is to a remote (Internet) site

In my hyperlinks I simply use the name and location of the target file on my computer.

It is possible to directly invoke a media player with a command line pointing to the media file desired and any command line parameters needed for full screen etc,

Something like

```
vlc --fullscreen full path and filename
```

This may take a little fiddling to get right – I have a memory that I sometimes needed to enclose path and file in quotes.

If preparing a presentation on one's desktop computer, for later delivery from a laptop do not change the media file location. I recommend placing all files for the Presentation in their own directory and moving it to the laptop.

The third link “The Sun Shines Bright” is to a copy of John Ford's favourite of his films. This is on the Internet Archive, I insert it to show how it is possible to link to an external source. It will take a little time to load as it must start the browser; you may then need to start the film.
